

Yet Another Rust SSG

A minimal static site generator built in Rust — not to compete with existing ones, but to learn the language by building something useful (and fun).

⚠ This project is not production-grade. It's a personal learning experiment. The code is simple, the structure is primitive, and that's the point.

✨ Features

-  Parses Markdown (`.md`) files with optional YAML frontmatter
 -  Uses [Tera](#) templates for rendering pages
 -  Supports a modern dark mode with toggle switch
 -  Hot reload with file watcher and WebSocket live refresh
 -  Blog + page routing system (`/blog/`, `/about.html`, etc.)
 -  `--prod` mode for minified HTML and deploy-ready output
 -  Simple dev server via [warp](#)
-

Project Structure

```
yet_another_rust_ssg/  
├── content/ # Markdown source files  
│   ├── pages/ # Static pages (about, contact, etc.)  
│   └── blog/ # Blog posts  
├── templates/ # HTML templates (Tera)  
│   ├── base.html  
│   ├── page.html  
│   └── blog.html  
├── static/ # Static assets (CSS, images)  
│   └── styles.css  
├── dist/ # Generated HTML output  
├── src/ # Rust codebase  
└── Cargo.toml # Rust dependencies
```

Getting Started

Requirements

- Rust (latest stable)
- Cargo

Build and Run in Development

```
cargo run
```

This will:

- Generate the site in the `dist/` folder
- Start a local server at `http://localhost:3000`
- Watch for content/template changes and reload the browser

Run in Production

```
cargo run -- --prod
```

Why Build This?

Because learning Rust by building something from scratch is incredibly rewarding. This project is not meant to replace Hugo, Zola, or Astro — it's a humble, self-contained SSG that taught me a lot about Rust, web tooling, and project structuring.
